BAYESIAN INFERENCE FOR DIFFUSIONS

Gareth Roberts^{1*}

¹ Lancaster University, Lancaster, UK

* `gareth.o.roberts@warwick.ac.uk`

This talk will survey recent advances in the area of Bayesian inference for diffusions, focusing mainly on the case of discretely observed data. Methodology relies heavily on MCMC, and one focus will be on the imputation of unobserved diffusion bridges running between consecutive observations. The use of “exact” (ie free from discretisation error) methods and “perfect exact” methods will also be described.
